1. Design overview

1.1. Purpose

This document aims to describe the software design of a Java application named CIA Factbook Mapper for displaying and generating maps. It provides background information of the design phase, a list of necessary tools to develop the application, as well as detailed diagrams of the application's framework that will be useful for software developers.

1.2. Overview

The Design Overview contains the utilities and other related information that will be encountered in further development of the application. It lists the technology, libraries, and related file formats necessary to build the application. The Class Diagrams section contains fully-detailed figures describing the framework of the application, while the Sequence Diagrams section contains figures describing the step-by-step function calls between classes. The design of these diagrams was made using a top-down approach, such as in the case of distinct handling of the two different file formats (i.e. .dbf and .shp) utilized by the program. Furthermore, due to the nature of the application, certain parts of the program will employ the singleton pattern.

1.3. Tools

The diagrams were made with the object-oriented programming capability of Java in mind. As such, it is imperative to use Java and a corresponding IDE such as Eclipse to develop the application.

1.4. Libraries

Most of the class diagrams include components from the Java Class Library.

1.5. File formats

- **.dbf.** Contains database-type of information where world data facts and figures are stored which will be read by the program and displayed to the user.
- **.shp.** Contains each country's shape through vertices that will be read by the program to render an image of the world map.
- **.obj.** This file format will be used by the program to store user-specified map rendering settings outside the application.
- **.png.** All images including button icons and program-generated map images will be in this image format.

1.6. Target platform

The application will work in any platform with Java SE 6.0 Runtime Environment.
